GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: YE, Jame et al.
TITLE OF INVENTION: ISOLATED HUMAN RAS-LIKE PROTEINS,
TITLE OF INVENTION: NUCLEIC ACID MOLECULES ENCODING THESE HUMAN RAS-LIKE
FILE REFERENCE: CL001188
CURRENT PELLING NUMBER: US/09/817, 198A
CURRENT FILING DATE: 2001-03-27
NUMBER OF SEQ ID NOS: 33
SSCTWARE: FastsEQ for Windows Version 4.0
ELENGTH: 601
                    1195

Sequence 885, Application US/09834975

Sequence 885, Application US/09834975

Patent No. US20020110815A1

GENERAL INFORMATION:

APPLICANT: Lillie, James

APPLICANT: Brown, Jeffrey

APPLICANT: Bolt, Andrew

APPLICANT: Pandrew

TITLE OF INVENTION: NOVEL GENES, COMPOSITIONS AND METHODS

TITLE OF INVENTION: OF HUMAN CANCERS

TITLE REPERENCE: MRI-016B

CURRENT APPLICATION NUMBER: US/09/834,975

CURRENT APPLICATION NUMBER: 60/197,538

PRIOR FILING DATE: 2000-04-14

NUMBER OF SEQ ID NOS: 1046

SOFTWARE: FEALSEED FOR Windows Version 4.0

Sequence 879, Application US/09834975

Patent No. US20020110815A1

GENERAL INFORMATION:
APPLICANT: Lillie, James
APPLICANT: Brown, Jeffrey
APPLICANT: Brown, Jeffrey
APPLICANT: Boit, Andrew
TITLE OF INVENTION: NOVEL GENES, COMPOSITIONS AND METHODS
TITLE OF INVENTION: FOR THE IDENTIFICATION, ASSESSMENT, PREVENTION
TITLE OF INVENTION: FOR THE IDENTIFICATION, ASSESSMENT, PREVENTION: OF HUMAN CANCERS
TITLE REFERENCE: MRI-016B
CURRENT FILING DATE: 2001-04-13
PRIOR FILING DATE: 2000-04-14
NUMBER OF SEQ ID NOS: 1046

SOFTWARE: FASTSEQ for Windows Version 4.0

SEQ ID NO 879
LENGER: 2497
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                      /SIDS2/gcgdata/geneseq/geneseqn-emb1/NA1980.DAT:*

(HUMA-) HUMAN GENOME SCI INC

Rosen CA, Barash SC, WPI; 2001-483426/52 human immune/hematopoietic antigen polypeptides, diagnosing and/or treating cancers and Nucleic acids encoding useful for preventing, metastasis metastasis

Disclosure; SEQ ID NO 37097; 3071pp + Sequence Listing; English

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to

```
supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially aconcers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK54921 to AAK54950 and AAW82169 represent sequences used in the exemplification of the present invention.

AAC7446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepstotropic; vulnerary; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antidiabetic; hypotensive; dermatological; immunosuppressive; antithyroid; and antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining pathological conditions associated with an OREX-associated disorder. The nucleic acids and nucleic acids may be used to treat cancers, propliferative disorders, neuroders and nucleic acids may be used to treat cancers, propliferative disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     proliferative disorders, neurodegenerative disorders, osteoarthrits, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral, bacterial or fungal infection, malaria, autoimmune disorders, asthma, allergies, aplastic anaemia, burns, wounds, bone and cartilage damage, nocturnal haemoglobinuria, antiinflammatory disease; to enhance

```
The invention relates to a nucleic acid comprising a sequence at least 18 bases in length of a segment of the chemically pretreated DNA of genes associated with pharmacogenomics according to one of the sequences of the genes ALDH6 (NM_000693), CYP11A (NM_000781), CYP11B (NM_000497), CXP3A3 (NM_000776 and NM_017460), DPYD (NM_000110), EPHX2 (NM_000497), OCLN (NM_000538), TANRRI (NM_000378), ONE (NM_003380), NM_01990, NM_019902, NM_019902, NM_019903, NM_019903
                                                                                                                                        1363
                                                                                                                                                                                                                                                                                                                                                                                                                                    1487
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    1547
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1607
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; ds; bisulphite treatment; CpG; DNA methylation; cancer; tumour; cytostatic; ALDH6; CYP1181; CYP3A3; DPYD; EPHX2; OCLN: TXNRD1; UGT8; MRP; pharmacogenomics; SNP; single nucleotide polymorphism.

ő
which hybridises to or is identical to a chemically pretreated DNA of genes associated with pharmacogenomics and their complements, arranged in an array for analysing diseases associated with the methylation state (CpG) and/or detecting SNPS (single nucleotide polymorphisms) of the 87 sequences. The oligomers may also be used as PCR primers on the set of 87 nucleic acids and their complements is useful for diagnosis and therapy of solid tumours and cancer. The present sequence represents one the 87 DNA sequences or its complement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      2115

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid reluxeemia, Alzheimer's disease, Alzh. epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.

The invention relates to a nucleic acid comprising a sequence at least 18 bases in length of a segment of the chemically pretreated DNA of genes associated with pharmacogenomics according to one of the sequences of the genes ALDHG (NM_000693), CYP11A (NM_000781), CYP11B1 (NM_000497), CYP333 (NM_000776 and NM_017460), DPYD (NM_000110), EPHX2 (NM_0004996, NM_019900, NM_019901, NM_019902, NM_019808, NM_019809) and their complementary sequences, or a sequence (S1) chosen from 87 sequences and their complements. The chemical pretreatment to convert cytosines (but not methyl-cytosines) into uracilis. Also included are an oligomer (II) in particular an oligomer capture of a beptide nucleic acid (PNA)-oligomer, comprising in cach case at least one base sequence having a length of 9 nucleotides which hybridises to or is identical to a chemically pretreated DNA of genes associated with pharmacogenomics and their complements, arranged in a rary for analysing diseases associated with the methylation state (CG) and/or detecting SNPS (single nucleotide polymorphisms) cof the 87 sequences. The oligomers may also be used as PCR primers. The set of 87 nucleic acids and their complements is useful for diagnosis and therapy of solid tumours and cancer. The present sequence capta for this patent directly from MIPO at the complement of the printed specification, but was obtained in electronic of the printed specification, but was obtained in electronic for the printed specification, but associated for an electronic of the printed specification, but associated for an electronic of contine directly from MIPO at the complement of the printed specification, but associated for an electronic of the printed specification, but associated for an electronic of the printed specification, but associated for an electronic form part for the printed are an electronic form part for the printed are an electronic form part for the printed and the electronic form part for the printed and the electronic form part for the electronic form part for the e
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   GCCTGCCTCTTTGGGGAACTGAGCTCAGAGGTGCTTCAGAGAAGAAACAAATGA 1517

                               The present invention provides a number of human immune system associated genes which are modified by the methylation of cytosines. The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid reluxeamia, Alzheimer's disease, Alz, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         7503

The invention relates to novel isolated polypeptides (I), and displaced diagnosing, preventing and treating diseases including immune system disponders (e.g. congenital and acquired immunodeficiencies, autoimmune classorders (e.g. congenital and acquired immunodeficiencies, autoimmune disorders (e.g. theumatoid arthritis), inflammatory conditions, organ transplant rejections and graft versus host disease, infectious diseases (e.g. hepatitis C), bleeding disorders, infectious diseases classorders, primary haematopolotic disorders, myeloproliferative disorders (e.g. dasorders (sickle cell anaemia), myeloproliferative disorders (e.g. Alzhelmer's disease, Parkinson's disease), chromosomal abnormalities (Down syndrome), ischaemic injury (e.g. strongers), renal abnormalities (e.g. alzhelmer's disease, Parkinson's disease), chromosomal abnormalities (e.g. glomerulonephritis), cardiovascular disorders (e.g. arrhythmia), respiratory disorders, dermatological disorders, in wound healing, epithelial cell proliferation, endocrine disorders; (e.g. arrhythmia) epithelial cell proliferation, endocrine disorders, in wound healing, epithelial cell proliferation, endocrine disorders; (as stimulators of B-cell responsiveness to pathogens, activators of as stimulators of B-cell responsiveness to pathogens, activators of tumour proliferation in pathologies e.g. acquired immune deficiency syndrome (ADDS). AAS2096-AAS2080 represent novel signal transduction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel polypeptides useful for diagnosing, treating, preventing and/or prognosing disorders related to the proteins, including cancers, immune disorders and neuronal disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 1; SEQ ID No 88; 880pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes novel polypeptide fragments (I) and the polynucleotides (II) that encode them that are highly expressed in a human bladder tumour and which have cytostatic activity. (II) are used for recombinant expression of (I) and to isolate complete genes. (I) are used to identify agents suitable for treatment of bladder cancer, to directly treat this form of cancer (including expression from gene therapy vectors) or are used in a preparation for cancer treatment. (I) is also used for the generation of specific antibodies. (II) are identified by assembling ESTS (expressed sequence tags) from a particular tissue type before comparison of expression patterns. This allows a significantly longer fragment of the gene to be revealed, and therefore reduces the number of failures associated with the fact that ESTS from different libraries may represent different parts of the same unknown gene, distorting the estimated frequency of occurrence in a capture isolated from a human bladder tumour cDNA library which encode the proteins represented in AAY66143·Y66198.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ij

The invention relates to polynucleotides encoding colon tumour proteins. The polynucleotides and encoded polypeptides are useful in pharmaceutical compositions, such as vaccines, for the diagnosis, prevention, and treatment of colon cancer. Polynuclectide sequences may be used as hybridisation probes or primers, and in the design and preparation of ribozyme molecules for inhibiting expression of tumour polypeptides and proteins in tumour cells. The compositions are useful for stimulating an immune response against cancer, particularly for the immunotherapy of colon cancer, and as markers for the progression of cancer.

ABK4450-ABK46237 represent coding sequences of human colon tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Note: With the exception of SEQ ID No 1 and 2, the sequence data for this patent did not form part of the printed specification but was supplied by the European Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New colon cancer polypeptides and polynucleotides, useful as vaccines, for diagnosing, preventing, and treating colon cancer, and as markers for the progression of cancer -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         CTAGGGAAGTAGGTGATGCCAGCCCTCAAGTCTGTCTTCAGCCAGGGACTTGAGAAGTTA 2701

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the structure and/or properties of the agent. MI can be used in the structure and/or actiona, clear collected actionactic cancer, infilitating ductal cancer, infilitating lobular cancer, squamous cell carcinoma, neuroendocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              2790 CCCCCTCAGGAAAGAAGGACTATATTTGTACTGTACCCTAGGGGTTCTGGAAGGGAAAC 2849

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A single-stranded DNA (or its complementary strand or the corresp. Couble-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAT19001-T26837 and which is able to hybridise to part of human genomic DNA, CDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of CDNA was initiated from the 3'-end of mRNA by using poly(") as the sole primer. Since the 3'-end of mRNA by using poly(") as the sole primer. Since the 3'-en untranslated sequence; sunique to a particular mRNA species, almost all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of clifferent mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and probes derived from the GS sequences) as a means of diagnosing abnormal cell function or for

ABL36412 to ABL38645 represent human colon tumour antigen cDNA clones (I)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            which were isolated from human colon tumour and colon metastatic tumour cDNA libraries. (I) have cytostatic activity and can be used in vaccine production. (I) can be used for stimulating and/or expanding T cells specific for a tumour protein on contact with the T cells. They are also useful for inhibiting the development of cancer in a patient. (I) can be used as probes or primers for nucleic acid hybridisation, for preparing mutant species primers, or primers for use in genetic constructions. (I) can be used in the diagnosis of a colon tumour.
                                                                                                                           2991
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel isolated colon tumor polynucleotide differentially expressed in colon tumor or colon metastatic tumor and polypeptides encoded by them useful for inhibiting development of cancer in patient -

Sequences ABAB10981-ABB12330 represent 1350 novel human polypeptides, and sequences ABA08225-ABA09574 represent nucleic acids encoding them. The invention also relates to vectors and recombinant host cells comprising a nucleotide of the invention, methods of producing the novel polypeptides.

CC uncleotide of the invention, methods of identifying compounds which control to polypeptides of the invention. Although novel, many of the polypeptides of the invention. Although novel, many of the polypeptides of the invention have homology to known proteins, thereby giving an insight into their probable biological activities, and hence potential therapeutic applications. The polypeptides of the invention may have various activities, including cytokine, cell proliferation or cell differentiation activities; stem cell growth factor activity; immunomodulatory activity; tissue growth activity; concentrated activities; or may be encounted and activities; or may activity; involved in oncogenesis, cancer cell proliferation or metastasis.

CC chemotactic or chemokinetic activities, hadmostatic, thrombotic or thrombolytic activities, receptor or ligand activities; or may be conditions, e.g., by protein or gene therapy. Such conditions include conditions, e.g., by protein or gene therapy. Such conditions include careers, hematoposited disorders (e.g., metalions or ameliorating medical carefrail is schemial, bound disorders (e.g., osteoporosis), and abnormal activities may be used to promote wound repair (or nucleic acids encoding them) may be used to promote wound repair indications incisions and ulcers), while those with immunomodulatory activities may be used in the treatment of viral, and becent and fungal infections in addition to immune disorders to promote call growth. Polypeptides with prowth factor activity may be used in cell culture to give rise to neuropeptides with growth factor activity may be used in cell conditions and cells in culture to give propage to element of the promote cell growth factor activity may be us

Such conditions include ovarian cancer and breast cancer, and metastatic tumours of ovarian or breast origin, reproductive system (alsorders (e.g., infertility, disorders of pregnancy, anovulation, polycystic ovary syndrome, ovarian oysts, and dysmenorrhoea), endocrine disorders (e.g., chlamydia, HIV, toxoplasmosis, and toxic shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and vaginitis), immune disorders (e.g., congenital and acquired immunodeficiencies, autoimmune oophoritis, systemic lupus erythematosus), blood-related disorders (e.g., anaemia), cardiovascular disorders;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ovarian cancer; breast cancer; tumour; reproductive system disorder; infertility; pregnancy disorder; anovulation; polycystic ovary syndrome; PCOS; ovarian cyst; dysmenorrhoea: endocrine disorder; infection; inflammatory condition; immune disorder; blood disorder; restinancy cardiovascular disorder; respiratory disorder; neurological disorder; gastrointestinal disorder; urinary system disorder; drug screening; gene therapy; chromosome mapping; forensic analysis; antibody preparation; cytostatic; immunomodulatory; neuroprotective; antiinflammatory; gynaecological; reproductive; gene; ss.

respiratory disorders, neurological disorders, gastrointestinal disorders
             and urinary system disorders. Ovarian antigen polypeptides and polypucleotides may also be used in screening for compounds which modulate ovarian antigen expression or activity. The polypucleotides may further be used for gene therapy, chromosome mapping, in the identification of individuals and in forensic analysis, and the useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents cDNA encoding a human ovarian antigen of the
                                                                                                                                                                               Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
